In an ideal transformer (ignoring any losses), the power available in the secondary winding will be the same as the power in the primary winding, they are constant wattage devices and do not change the power only the voltage to current ratio. Thus, in an ideal transformer the Power Ratio is equal to one (unity) as the voltage, V multiplied by ...

Current transformers (CTs) are used throughout the world as current transducers for protective relays in industrial, commercial, and utility applications. Standard ratings and application guides deal with the steady-state sine wave behavior of current transformers.

Transformer Differential Protection Scheme works by using two separate quantities calculated from the primary current (IW1C) and secondary current (IW2C). SEL787 and SEL 387/587 Transformer differential relay is used for this discussion. Other similar relays use similar concepts through the actual terminology could be different.

25/33MVA 69/23kV Delta-Wye Transformer on SEL-387A Relay Figure 1. Transformer Vector Group and CT to Relay Connection. We will start the transformer differential protection calculation with the identification of the transformer vector group. For this example, we have a 25/33MVA 69/23kV Delta-Wye Transformer with vector group, Dyn1.

As dry transformer is a static device with no moving parts, it has a trouble free life under normal operating conditions. There are multiple insulation classes such as Class A (105°C), Class B (130°C), Class F (155°C),

Class H (180°C) and Class R (220°C) and the proper one should be selected according to the needs and design for reliable transformer operation and life.

What is the Average Life Expectancy of a Transformer

Figure 1 shows a simple differential protection scheme, also known as a Merz-Price scheme.. In this simple scheme, we can assume that under normal operating conditions, the current entering into the piece of equipment under protection is equal (or in the case of a transformer, proportional) to its exiting current. In this example we will assume that the entry and exit currents are equal.

CT or current transformer burden: CT burden is an impedance of secondary circuit expressed in ohms and power factor. This power factor is not the power factor of secondary load. CT Burden can be expressed in two terms- as example. 5 ohm impedance; 10 VA at 5A. (British method)- here 5A is rated secondary current and 2Volt across secondary. Knee ...

As discussed in the post "Transformer Differential Protection", differential protection is supposed to operate for the internal faults or for the zone of protection it is intended for. Differential protection is not supposed to operate for a through fault. Through fault means a fault outside the zone of protection. Thus as discussed in earlier post, ...
